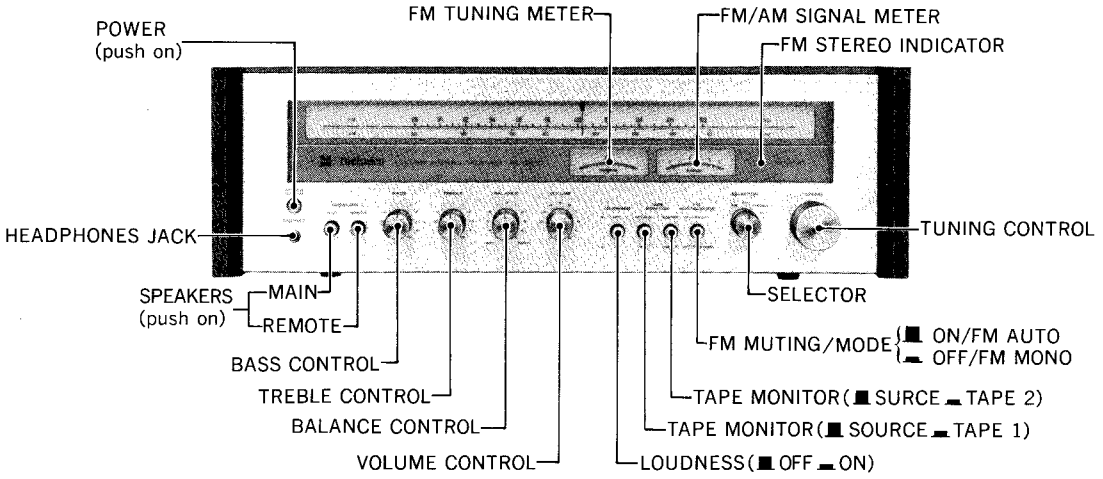
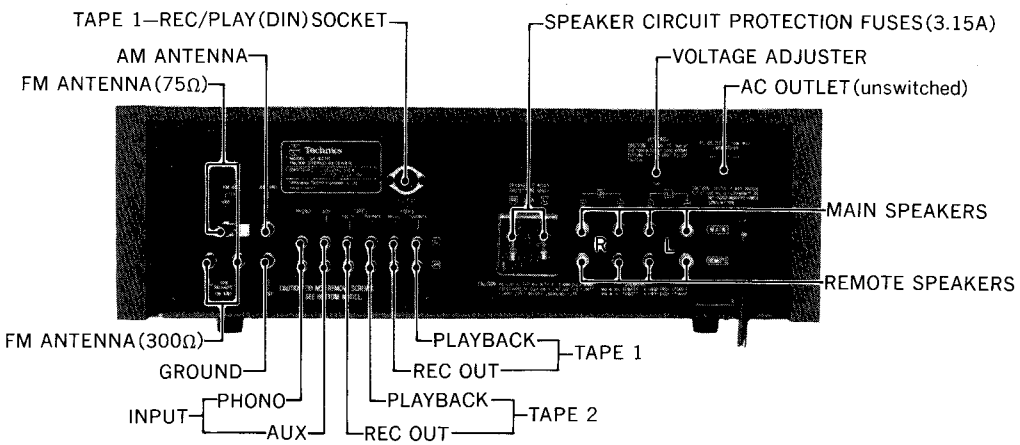
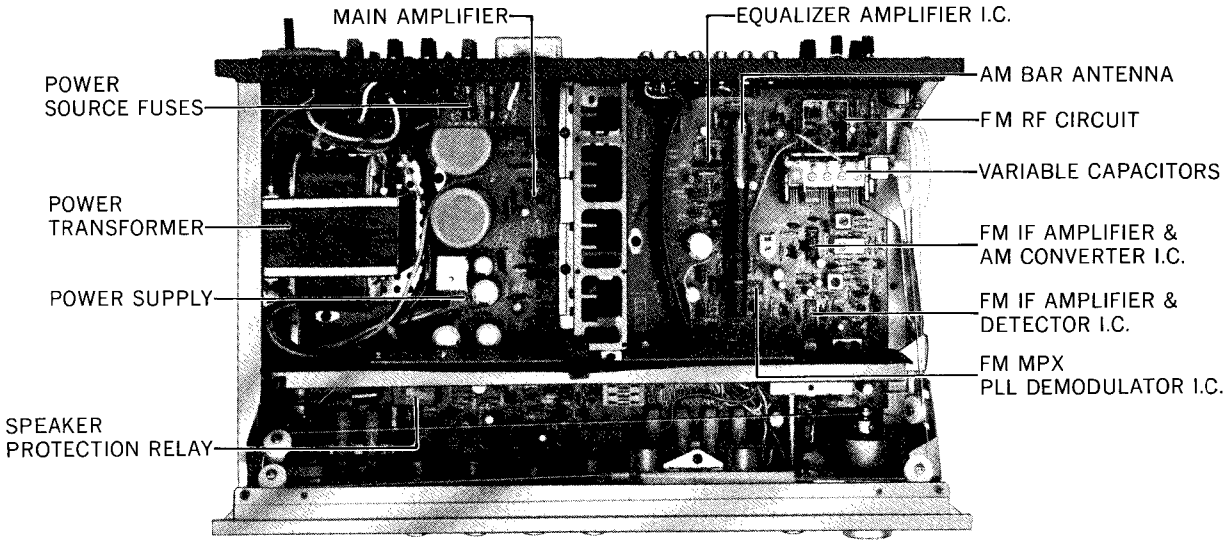
■ LOCATAION OF CONTROLS





- This photo shows only the products for [XA]
- The products for other desitnations except [XA] are not equipped with AC outlet.
- For further remark, the products for [XAL] are not provided with voltage adjuster and AC outlet.



■ NOTE

The unit is provided with the speaker circuit protection fuses at the right and left channels respectively. The fuse is to prevent the power transistor from destruction, should the speaker terminals be short-circuited. Accordingly, if the unit fails to function upon completion of the speaker connections, check the speaker protection fuses first of all for possible blowing.

■ TO REMOVE CABINET

(Products for [XA] and [XAL] only)

1. Remove four (4) cabinet-mounting screws (① ~ ④), as shown in fig.4.
2. Remove cabinet from chassis.
3. When installing the front panel, insert the cabinet edge into grove of front panel as shown in fig.5.

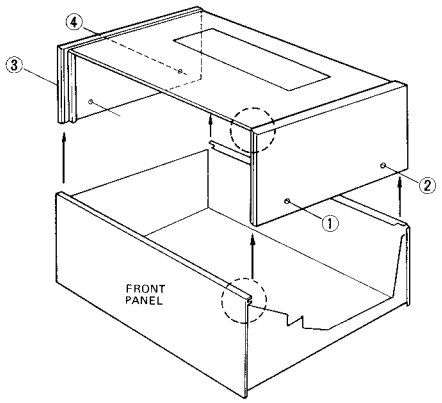

Fig. 4

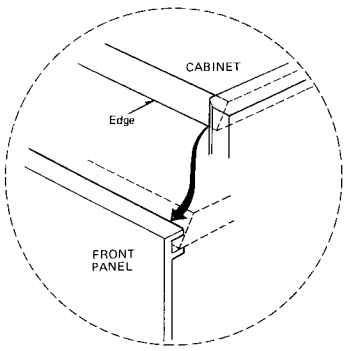

Fig. 5

■ TO REMOVE BOTTOM BOARD

1. Remove eight (8) bottom board-mounting screws (① ~⑧), as shown in fig. 6.
2. When the bottom board is to be removed for repair, never remove any screws other than set screws for the bottom board. Energization of the unit with screws other than the bottom board set screws removed may result in troubles in the circuit.

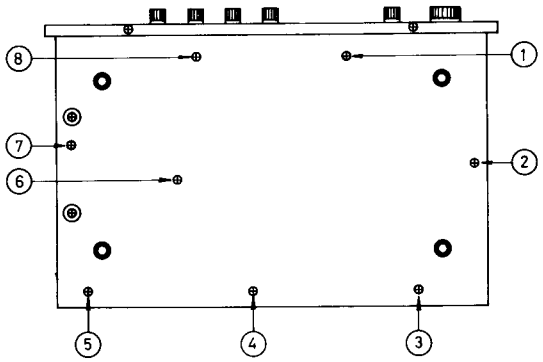

Fig. 6

■ ALIGNMENT INSTRUCTIONS... MAIN AMPLIFIER CIRCUIT

- When the power transistor is replaced, be sure to apply silicone compound (or equivalent thermal diffusion agent) onto the mica plate, and at the same time confirm the idling current of the power transistor. (measure voltage across the emitter resistance)

Ⓐ For adjustment with DC voltmeter

1. Turn the speaker switch "OFF".
2. Connect the DC voltmeter as shown in "Alignment Points". (Fig. 1)
3. If the reading is under 25mV approximately several minutes after turning ON the power supply, the circuit is "OK". On the other hand, if the reading is over 25mV, cut off the lead wire for (J2) in the case of left channel (The lead wire for (J1) in the case of right channel).
4. Should the reading not fall under 25mV even when the lead wire has been cut off, there is something wrong with the circuit, and therefore, check the power source circuit or main amplifier circuit.

NOTE: When cutting off the lead wire, cut off the same at the root.

Ⓑ Current should be checked only when adjustment is made with a tester. (measuring instrument incapable of measuring voltage in mV unit.)

1. Turn OFF the power supply for the set.
2. Connect the ammeter as shown in Fig. 3 (Case of right channel).
3. After ensuring that the ammeter will not come off, turn ON the power supply.
4. If the reading is under 75mA after several minutes (But, when nothing resistance of internal resistor by ammeter) the circuit is "OK". If over 75mA, cut off the lead wire for (J2) in the case of left channel (The lead wire for (J1) in the case of right channel).
5. If the reading does not fall under 75mA, there is something wrong with the circuit.

NOTE: The adjustment may be made either by Ⓐ or by Ⓑ method. (We recommend the method Ⓐ where possible). Figs. 2 and 3 are related to the case of right channel.

■ ALIGNMENT INSTRUCTIONS ... FM AND AM TUNER CIRCUIT

NOTE For adjustment, proceed with the bottom board attached as it is.

Notes:
1. Selector switch ..... {AM (AM Alignment) / FM (FM Alignment)
2. FM Muting/mode switch ..... on/FM auto
3. Maintain line voltage at rated voltage.
4. Tape monitor switch ..... Source
5. Speakers switch ..... MAIN and REMOTE to ON
6. Volume control ..... Variable
7. Output of signal generator should be no higher than necessary to obtain an output reading.
8. 300Ω FM dummy antenna ..... Refer to fig. 7.

■ ABGLEICHANWEISUNGEN (Verstärkerteil)

- Wenn der Netztransistor ersetzt wird, ist zu beachten, daß eine Siliziumverbindung (oder ähnliches Thermodiffusionsmittel) auf die Glimmerplatte gegeben wird, und zur gleichen Zeit der Blindstrom des Netztransistors festgestellt wird.. (Die Spannung über den Emitterwiderstand messen.)

Ⓐ Zum Justieren mit dem Gleichstrom-Voltmeter

1. Drehen Sie den Lautsprecherschalter auf "OFF".
2. Schließen Sie den Gleichstrom-Voltmeter an, wie in Abb. 1 des Justrerpunkte-Diagramms gezeigt.
3. Falls die Anzeige weniger als ca. 25 mV beträgt, so ist die Schaltung in Ordnung. Falls aber die Anzeige mehr als 25 mV beträgt, sehneiden Sie den Leitungsdraht für (J2) im Palle des linken Kanals weg (oder den Leitungsdraht für (J1) im Falle des rechten Kanals) .
4. Falls die Anzeige auch nach Unterbrechen des Leitungsdrahtes nicht unter 25 mV fällt, so ist die Schaltung nicht in Ordnung, und die Stromquellenschaltung und die Hauptverstärkerschaltung müssen überprüft werden.

ANMERKUNG: Falls das Wegschneiden des Leitungsdrahtes nötig ist, schneiden Sie diesen nahe am Anschlußpunkt weg.

Ⓑ Die Stromstärke sollte nur gepräft werden, wenn die Justierung mit einem Prüfgerät vorgenommen wird. (Mit dem Meßinstrument kann die Spannung nicht in mV gemessen werden.)

1. Schalten Sie die Stromzufuhr zum Gerät aus.
2. Schließen Sie das Ammeter an, wie in Abb. 3 gezeigt.
3. Nachdom Sie sich vergewissert haben, daß das Ammeter solide befestigt ist, schalten Sie die Stromzufuhr ein.
4. Falls die Anzeige einige Minuten nach dem Einschalten weniger als 75 mA beträgt, so ist die Schaltung in Ordnung. Liegt die Anzeige über 75 mA, schneiden Sie den Leitungsdraht für (J2) im Falle des linken Kanals weg. (oder den Leitungsdraht für (J1) im Falle des rechten Kanals) .
5. Falls die Anzeige auch dann nicht unter 75 mA fällt, so ist die Schaltung defekt.

ANMERKUNG: Die Justierung kann entweder nach Methode Ⓐ oder Ⓑ vorgenommen werden. (Wo möglich, empfehlen wir Methode Ⓐ . Die Abbildungen 2 und 3 beziehen sich auf den linken kanal.

■ INSTRUCTIONS D'ALIGNEMENT (Partie amplificateur)

- Lorsque le transistor de puissance est remplacé, s'assurer d'appliquer le composé de silicone (ou un agent de diffusion thermique équivalent) sur la plaque de mica et confirmer en même temps le courant déwatté du transistor de puissance. (Mesurer la tension à travers la résistance de l'émetteur).

Ⓐ Pour la mise au point avec un voltmetre C.C.

1. Tourner le commutateur de haut-parleur sur "OFF".
2. Connecter le voltmètre C.C. comme dans la Fig. 1 du schéma des endroits de vérification.
3. Si la lecture est approximativement inférieure à 25 mV plusieurs minutes après la mise en marche de l'alimentation, le circuit fonctionne correctement. Par contre, si la lecture est au-delà de 25 mV, couper le fil de jonction pour (J2) dans le cas du canal Gauche [L] , (le fil de jonction pour (J1) , dans le cas du canal Droite [R]).
4. Si la lecture ne descends pas au-dessous de 25 mV même lorsque le fil de jonction a été coupé, cela signifie qu il y a quelque chose d'incorrect dans le circuit et par conséquent, il sera nécessaire de vérifier le circuit d'alimentation ou le circuit d'amplification principal.

REMARQUE: Lorsqu'on coupe le fil de jonction, le couper à l'extrémité de sa racine.

Ⓑ Le courant ne devra être vérifié seulement que lorsque la mise au point est faite avec un appareil contrôleur. (Appareil de mesure incapable d'une tension de mesure dans un appareillage de mV).

1. Couper l'alimentation de l'appareillage.
2. Brancher l'ampèremètre, comme il est montré à la Fig. 3.
3. Après s'être assuré que l'ampèremètre n'est pas débranché, mettre en marche l'alimentation.
4. Si la lecture est inférieure à 75 mA après plusieurs minutes, le circuit fonctionne correctement. Si par contre la lecture va au-delà de 75 mA, couper le fil de jonction pour (J2) dans le cas du canal Gauche [L] , (le fil de jonction pour (J1) , dans le cas du canal Droite [R]).
5. Si la lecture ne descends pas au-dessous de 75 mA, cela signifie qu'il y a quelque chose de défectueux dans le circuit.

REMARQUE: La mise au point doit être faite soit avec la méthode Ⓐ, soit avec la méthode Ⓑ. (Si c'est possible, nous recommandons la méthode Ⓐ. Les Figures 2 et 3 se rapportent au cas du canal Gauche [L].

IMPORTANT SAFETY NOTICE

THE SHADED AREA ON THIS SCHEMATIC DIAGRAM INCORPORATES SPECIAL FEATURES IMPORTANT FOR SAFETY. WHEN SERVICING IT IS ESSENTIAL THAT ONLY MANUFACTUR'S SPECIFIED PARTS BE USED FOR THE CRITICAL COMPONENTS IN THE SHADED AREAS OF THE SCHEMATIC.

NOTES:

1. S1-1 ~ S1-6: Selector switch in "AM" position.
   ① AM ↔ ② FM ↔ ③ PHONO ↔ ④ AUX
2. S2: FM muting/FM mode switch in "ON/FM AUTO" position.
3. S3: Tape monitor 1 switch in "SOURCE" position.
4. S4: Tape monitor 2 switch in "SOURCE" position.
5. S5: Loudness switch in "OFF" position.
6. S6-1, S6-2: Main speaker switch in "OFF" position.
7. S7-1, S7-2: Remote speaker switch in "OFF" position.
8. S8: Power source switch in "OFF" position.
9. S9: Voltage selector switch in "110V" position.
   ④ 110V ↔ ③ 120V ↔ ② 220V ↔ ① 240V
10. Indicated voltage values are the standard values for the unit measured by the DC electronic circuit tester (high impedance) with the chassis taken as standard. Therefore, there may exist some errors in the voltage values, depending on the internal impedance of the DC circuit tester.
    ▭ FM monoral signal reception.
    ( ) AM position.
    < > FM stereo signal reception.
    ⌜ ⌟ FM muting circuit operating position.

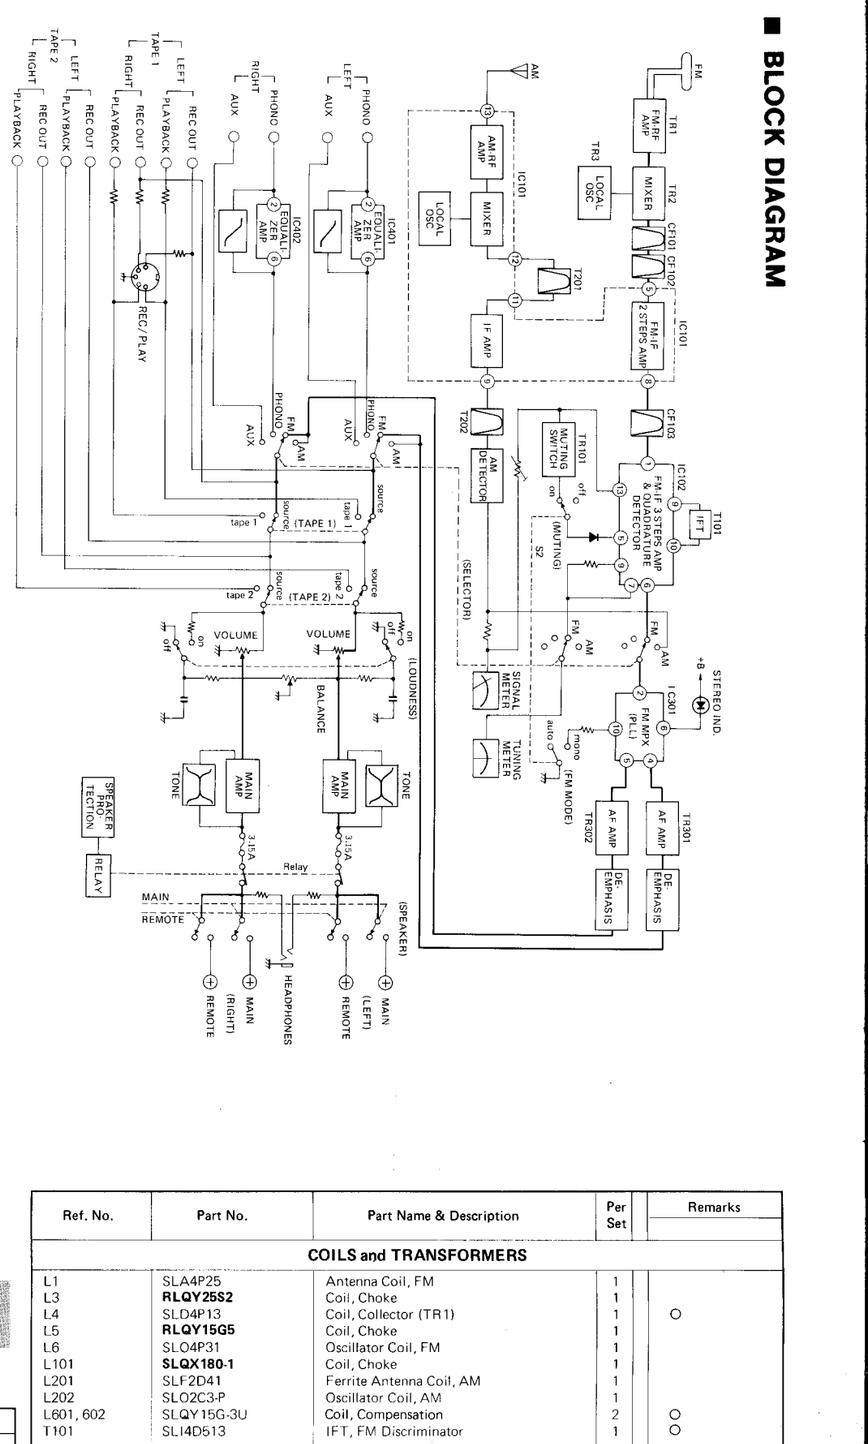
■ BLOCK DIAGRAM



■ SERVICE AID

At the initial stage of the main amplifier of this unit, the differential amplifier of current mirror load is employed.

This is a circuit for obtaining the gain higher than that in the conventional circuits, with current in the differential amplifier stage kept constant.

When Ic1 is increased through variation of base voltage of the differential amplifier TR1, Ic2 at TR2 is reduced with consequent decrease in the voltage drop at R2, this in turn reduces VEB of TR3, and thus Ic 1 gradually decreases. On the contrary, when Ic 1 of TR1 is reduced, Ic 2 of TR2 is increased with increase of voltage drop at R2, thus resulting in rise of VEB for TR3 and consequent increase of Ic 1. As the characteristics of the differential amplifier, Ic2 is reduced as Ic 1 is increased. In this way, Ic 1 and Ic 2 are kept constant at all times through functioning of TR3.

Constant current means that high impedance is connected to the differential amplifier circuit, and thus large voltage gain can be obtained. Another cause for increasing the voltage gain is the push-pull circuit formed by TR1 and TR3. In the differential amplifier, signal of opposite phase is obtained at the collector of TR1 with respect to the input signal, while in the collector of TR2, signal of the phase as the input is obtained to be further applied to the base of TR3.

Accordingly, signal of opposite phase to the input is developed at the collector of TR3, thus consequently forming the push-pull circuit of TR1 and TR3. In other words, since the amount of NF can be increased with the rise of the gain, improvements in the distortion factor and S/N ratio can be achieved.
