

CC2640 SimpleLink™ Bluetooth® Wireless MCU

1 Device Overview

1.1 Features

- Microcontroller
 - Powerful ARM® Cortex®-M3
 - EEMBC CoreMark® Score: 142
 - Up to 48-MHz Clock Speed
 - 128KB of In-System Programmable Flash
 - 8KB of SRAM for Cache
 - 20KB of Ultralow-Leakage SRAM
 - 2-Pin cJTAG and JTAG Debugging
 - Supports Over-The-Air Upgrade (OTA)
- Ultralow-Power Sensor Controller
 - Can Run Autonomous From the Rest of the System
 - 16-Bit Architecture
 - 2KB of Ultralow-Leakage SRAM for Code and Data
- Efficient Code Size Architecture, Placing Drivers, *Bluetooth*® Low Energy Controller, and Bootloader in ROM
- RoHS-Compliant Packages
 - 4-mm × 4-mm RSM VQFN32 (10 GPIOs)
 - 5-mm × 5-mm RHB VQFN32 (15 GPIOs)
 - 7-mm × 7-mm RGZ VQFN48 (31 GPIOs)
- Peripherals
 - All Digital Peripheral Pins Can Be Routed to Any GPIO
 - Four General-Purpose Timer Modules (Eight 16-Bit or Four 32-Bit Timers, PWM Each)
 - 12-Bit ADC, 200-ksamples/s, 8-Channel Analog MUX
 - Continuous Time Comparator
 - Ultralow-Power Analog Comparator
 - Programmable Current Source
 - UART
 - 2x SSI (SPI, MICROWIRE, TI)
 - I2C
 - I2S
 - Real-Time Clock (RTC)
 - AES-128 Security Module
 - True Random Number Generator (TRNG)
 - 10, 15, or 31 GPIOs, Depending on Package Option
 - Support for Eight Capacitive-Sensing Buttons
 - Integrated Temperature Sensor
- External System
 - On-Chip internal DC-DC Converter
- Very Few External Components
- Seamless Integration With the SimpleLink™ CC2590 and CC2592 Range Extenders
- Pin Compatible With the SimpleLink CC13xx in 4-mm × 4-mm and 5-mm × 5-mm VQFN Packages
- Low Power
 - Wide Supply Voltage Range
 - Normal Operation: 1.8 to 3.8 V
 - External Regulator Mode: 1.7 to 1.95 V
 - Active-Mode RX: 5.9 mA
 - Active-Mode TX at 0 dBm: 6.1 mA
 - Active-Mode TX at +5 dBm: 9.1 mA
 - Active-Mode MCU: 61 µA/MHz
 - Active-Mode MCU: 48.5 CoreMark/mA
 - Active-Mode Sensor Controller: 8.2 µA/MHz
 - Standby: 1 µA (RTC Running and RAM/CPU Retention)
 - Shutdown: 100 nA (Wake Up on External Events)
- RF Section
 - 2.4-GHz RF Transceiver Compatible With *Bluetooth* Low Energy (BLE) 4.2 Specification
 - Excellent Receiver Sensitivity (–97 dBm for BLE), Selectivity, and Blocking Performance
 - Link budget of 102 dB for BLE
 - Programmable Output Power up to +5 dBm
 - Single-Ended or Differential RF Interface
 - Suitable for Systems Targeting Compliance With Worldwide Radio Frequency Regulations
 - ETSI EN 300 328 (Europe)
 - EN 300 440 Class 2 (Europe)
 - FCC CFR47 Part 15 (US)
 - ARIB STD-T66 (Japan)
- Tools and Development Environment
 - Full-Feature and Low-Cost Development Kits
 - Multiple Reference Designs for Different RF Configurations
 - Packet Sniffer PC Software
 - Sensor Controller Studio
 - SmartRF™ Studio
 - SmartRF Flash Programmer 2
 - IAR Embedded Workbench® for ARM
 - Code Composer Studio™

1.2 Applications

- Home and Building Automation
 - Connected Appliances
 - Lighting
 - Locks
 - Gateways
 - Security Systems
- Industrial
 - Logistics
 - Production and Manufacturing
 - Automation
 - Asset Tracking and Management
 - Remote Display
 - Cable Replacement
 - HMI
 - Access Control
- Retail
 - Beacons
 - Advertising
 - ESL and Price Tags
 - Point of Sales and Payment Systems
- Health and Medical
 - Thermometers
 - SpO2
 - Blood Glucose and Pressure Meters
 - Weight Scales
 - Vitals Monitoring
 - Hearing Aids
- Sports and Fitness
 - Activity Monitors and Fitness Trackers
 - Heart Rate Monitors
 - Running Sensors
 - Biking Sensors
 - Sports Watches
 - Gym Equipment
 - Team Sports Equipment
- HID
 - Remote Controls
 - Keyboards and Mice
 - Gaming
- Accessories
 - Toys
 - Trackers

 - Wearables

1.3 Description

The CC2640 device is a wireless MCU targeting *Bluetooth* applications.

The device is a member of the CC26xx family of cost-effective, ultralow power, 2.4-GHz RF devices. Very low active RF and MCU current and low-power mode current consumption provide excellent battery lifetime and allow for operation on small coin cell batteries and in energy-harvesting applications.

The CC2640 device contains a 32-bit ARM Cortex-M3 processor that runs at 48 MHz as the main processor and a rich peripheral feature set that includes a unique ultralow power sensor controller. This sensor controller is ideal for interfacing external sensors and for collecting analog and digital data autonomously while the rest of the system is in sleep mode. Thus, the CC2640 device is ideal for a wide range of applications where long battery lifetime, small form factor, and ease of use is important.

The *Bluetooth* Low Energy controller is embedded into ROM and runs partly on an ARM Cortex-M0 processor. This architecture improves overall system performance and power consumption and frees up flash memory for the application.

The *Bluetooth* stack is available free of charge from www.ti.com.

2 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

| Changes from October 23, 2015 to July 5, 2016 | Page |
|--|-----------|
| • Added split VDDS supply rail feature | <u>1</u> |
| • Added 5-Mbps proprietary mode | <u>1</u> |
| • Added option for up to 80Ω ESR when C_L is 6 pF or lower | <u>18</u> |
| • Added tolerance for RCOSC_LF and RTC accuracy content | <u>19</u> |
| • Updated the Soc ADC internal voltage reference specification in Section 5.16 | <u>19</u> |
| • Moved all SSI parameters to Section 5.22 | <u>22</u> |
| • Added 0-dBm setting to the <i>TX Current Consumption vs Supply Voltage (VDDS)</i> graph | <u>27</u> |
| • Changed Figure 5-11, Receive Mode Current vs Supply Voltage (VDDS) | <u>27</u> |
| • Added Figure 5-21, Supply Current vs Temperature | <u>28</u> |

| Changes from February 15, 2015 to October 22, 2015 | Page |
|---|-----------|
| • Removed RHB package option from CC2620 | <u>6</u> |
| • Added motional inductance recommendation to the 24-MHz XOSC table | <u>18</u> |
| • Added SPI timing parameters | <u>22</u> |
| • Added VOH and VOL min and max values for 4-mA and 8-mA load | <u>24</u> |
| • Added min and max values for VIH and VIL | <u>25</u> |
| • Added <i>BLE Sensitivity vs Channel Frequency</i> | <u>27</u> |
| • Added <i>RF Output Power vs Channel Frequency</i> | <u>27</u> |
| • Added Figure 5-11, Receive Mode Current vs Supply Voltage (VDDS) | <u>27</u> |
| • Changed Figure 5-20, SoC ADC ENOB vs Sampling Frequency (Input Frequency = FS / 10) | <u>28</u> |
| • Clarified Brown Out Detector status and functionality in the <i>Power Modes</i> table. | <u>35</u> |
| • Added application circuit schematics and layout for 5XD and 4XS | <u>38</u> |

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾

| | | MIN | MAX | UNIT |
|---|---|------------|----------------------|-------------|
| Supply voltage (VDDS, VDDS2, and VDDS3) | VDDR supplied by internal DC-DC regulator or internal GLDO. VDDS_DCDC connected to VDDS on PCB. | -0.3 | 4.1 | V |
| Supply voltage (VDDS ⁽³⁾ and VDDR) | External regulator mode (VDDS and VDDR pins connected on PCB) | -0.3 | 2.25 | V |
| Voltage on any digital pin ⁽⁴⁾⁽⁵⁾ | | -0.3 | VDDSx + 0.3, max 4.1 | V |
| Voltage on crystal oscillator pins, X32K_Q1, X32K_Q2, X24M_N and X24M_P | | -0.3 | VDDR + 0.3, max 2.25 | V |
| Voltage on ADC input (V _{in}) | Voltage scaling enabled | -0.3 | VDDS | V |
| | Voltage scaling disabled, internal reference | -0.3 | 1.49 | |
| | Voltage scaling disabled, VDDS as reference | -0.3 | VDDS / 2.9 | |
| Input RF level | | | 5 | dBm |
| T _{stg} | Storage temperature | -40 | 150 | °C |

(1) All voltage values are with respect to ground, unless otherwise noted.

(2) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(3) In external regulator mode, VDDS2 and VDDS3 must be at the same potential as VDDS.

(4) Including analog-capable DIO.

(5) Each pin is referenced to a specific VDDSx (VDDS, VDDS2 or VDDS3). For a pin-to-VDDS mapping table, see [Table 6-3](#).

5.2 ESD Ratings

| | | VALUE | UNIT |
|------------------|---|--|-------------|
| V _{ESD} | Electrostatic discharge (ESD) performance | Human body model (HBM), per ANSI/ESDA/JEDEC JS001 ⁽¹⁾ | All pins |
| | | | ±2500 |
| | | Charged device model (CDM), per JESD22-C101 ⁽²⁾ | RF pins |
| | | | ±750 |
| | | | Non-RF pins |
| | | | ±750 |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

| | | MIN | MAX | UNIT |
|---|---|---------------------|------------|-------------|
| Ambient temperature range | | -40 | 85 | °C |
| Operating supply voltage (VDDS and VDDR), external regulator mode | For operation in 1.8-V systems (VDDS and VDDR pins connected on PCB, internal DC-DC cannot be used) | 1.7 | 1.95 | V |
| Operating supply voltage VDDS | For operation in battery-powered and 3.3-V systems (internal DC-DC can be used to minimize power consumption) | 1.8 | 3.8 | V |
| Operating supply voltages VDDS2 and VDDS3 | | 0.7 × VDDS, min 1.8 | 3.8 | V |

5.4 Power Consumption Summary

Measured on the TI CC2650EM-5XD reference design with $T_c = 25^\circ\text{C}$, $V_{\text{DDS}} = 3.0\text{ V}$ with internal DC-DC converter, unless otherwise noted.

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|-------------------|---|--|-----|-----|---------------|
| I_{core} | Reset. RESET_N pin asserted or VDDS below Power-on-Reset threshold | 100 | | | nA |
| | Shutdown. No clocks running, no retention | 150 | | | |
| | Standby. With RTC, CPU, RAM and (partial) register retention. RCOSC_LF | 1 | | | μA |
| | Standby. With RTC, CPU, RAM and (partial) register retention. XOSC_LF | 1.2 | | | |
| | Standby. With Cache, RTC, CPU, RAM and (partial) register retention. RCOSC_LF | 2.5 | | | |
| | Standby. With Cache, RTC, CPU, RAM and (partial) register retention. XOSC_LF | 2.7 | | | |
| | Idle. Supply Systems and RAM powered. | 550 | | | mA |
| | Active. Core running CoreMark | 1.45 mA + 31 $\mu\text{A}/\text{MHz}$ | | | |
| | Radio RX ⁽¹⁾ | 5.9 | | | |
| | Radio RX ⁽²⁾ | 6.1 | | | |
| | Radio TX, 0-dBm output power ⁽¹⁾ | 6.1 | | | |
| | Radio TX, 5-dBm output power ⁽²⁾ | 9.1 | | | |

Peripheral Current Consumption (Adds to core current I_{core} for each peripheral unit activated)⁽³⁾

| | | | | |
|-------------------|-------------------------|--|-----|---------------|
| I_{peri} | Peripheral power domain | Delta current with domain enabled | 20 | μA |
| | Serial power domain | Delta current with domain enabled | 13 | μA |
| | RF Core | Delta current with power domain enabled, clock enabled, RF core idle | 237 | μA |
| | μDMA | Delta current with clock enabled, module idle | 130 | μA |
| | Timers | Delta current with clock enabled, module idle | 113 | μA |
| | I^2C | Delta current with clock enabled, module idle | 12 | μA |
| | I ₂ S | Delta current with clock enabled, module idle | 36 | μA |
| | SSI | Delta current with clock enabled, module idle | 93 | μA |
| | UART | Delta current with clock enabled, module idle | 164 | μA |

(1) Single-ended RF mode is optimized for size and power consumption. Measured on CC2650EM-4XS.

(2) Differential RF mode is optimized for RF performance. Measured on CC2650EM-5XD.

(3) I_{peri} is not supported in Standby or Shutdown.

5.5 General Characteristics

Measured on the TI CC2650EM-5XD reference design with $T_c = 25^\circ\text{C}$, $V_{\text{DDS}} = 3.0\text{ V}$, unless otherwise noted.

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---|--|-----|------|-----|---------------|
| FLASH MEMORY | | | | | |
| Supported flash erase cycles before failure | | 100 | | | k Cycles |
| Flash page/sector erase current | Average delta current | | 12.6 | | mA |
| Flash page/sector size | | | 4 | | KB |
| Flash write current | Average delta current, 4 bytes at a time | | 8.15 | | mA |
| Flash page/sector erase time ⁽¹⁾ | | | 8 | | ms |
| Flash write time ⁽¹⁾ | 4 bytes at a time | | 8 | | μs |

(1) This number is dependent on Flash aging and will increase over time and erase cycles.

5.6 1-Mbps GFSK (Bluetooth low energy Technology) – RX

Measured on the TI CC2650EM-5XD reference design with $T_c = 25^\circ\text{C}$, $V_{\text{DDS}} = 3.0\text{ V}$, $f_{\text{RF}} = 2440\text{ MHz}$, unless otherwise noted.

| Selectivity, Image frequency $\pm 1\text{ MHz}$ ⁽¹⁾ | Wanted signal at –67 dBm, modulated interferer at $\pm 1\text{ MHz}$ from image frequency, $\text{BER} = 10^{-3}$ | | 3 / 26 ⁽²⁾ | | dB |
| Out-of-band blocking ⁽³⁾ | 30 MHz to 2000 MHz | | –20 | | dBm |
| Out-of-band blocking | 2003 MHz to 2399 MHz | | –5 | | dBm |
| Out-of-band blocking | 2484 MHz to 2997 MHz | | –8 | | dBm |
| Out-of-band blocking | 3000 MHz to 12.75 GHz | | –8 | | dBm |
| Intermodulation | Wanted signal at 2402 MHz, –64 dBm. Two interferers at 2405 and 2408 MHz respectively, at the given power level | | –34 | | dBm |
| Spurious emissions, 30 to 1000 MHz | Conducted measurement in a 50- Ω single-ended load. Suitable for systems targeting compliance with EN 300 328, EN 300 440 class 2, FCC CFR47, Part 15 and ARIB STD-T-66 | | –71 | | dBm |
| Spurious emissions, 1 to 12.75 GHz | Conducted measurement in a 50 Ω single-ended load. Suitable for systems targeting compliance with EN 300 328, EN 300 440 class 2, FCC CFR47, Part 15 and ARIB STD-T-66 | | –62 | | dBm |
| RSSI dynamic range | | | 70 | | dB |
| RSSI accuracy | | | ±4 | | dB |

(1) Numbers given as I/C dB.

(2) X / Y, where X is $+N\text{ MHz}$ and Y is $-N\text{ MHz}$.

(3) Excluding one exception at $F_{\text{wanted}} / 2$, per Bluetooth Specification.

5.7 1-Mbps GFSK (Bluetooth low energy Technology) – TX

Measured on the TI CC2650EM-5XD reference design with $T_c = 25^\circ\text{C}$, $V_{\text{DDS}} = 3.0 \text{ V}$, $f_{\text{RF}} = 2440 \text{ MHz}$, unless otherwise noted.

5.12 24-MHz Crystal Oscillator (XOSC_HF)

$T_c = 25^\circ\text{C}$, $V_{\text{DDS}} = 3.0 \text{ V}$, unless otherwise noted.⁽¹⁾

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---|--|-----|---------------------------------|-----|---------------|
| ESR Equivalent series resistance ⁽²⁾ | $6 \text{ pF} < C_L \leq 9 \text{ pF}$ | | 20 | 60 | Ω |
| ESR Equivalent series resistance ⁽²⁾ | $5 \text{ pF} < C_L \leq 6 \text{ pF}$ | | | 80 | Ω |
| L_M Motional inductance ⁽²⁾ | Relates to load capacitance (C_L in Farads) | | $< 1.6 \times 10^{-24} / C_L^2$ | | H |
| C_L Crystal load capacitance ⁽²⁾ | | 5 | | 9 | pF |
| Crystal frequency ⁽²⁾⁽³⁾ | | | 24 | | MHz |
| Crystal frequency tolerance ⁽²⁾⁽⁴⁾ | | -40 | | 40 | ppm |
| Start-up time ⁽³⁾⁽⁵⁾ | | | 150 | | μs |

(1) Probing or otherwise stopping the XTAL while the DC-DC converter is enabled may cause permanent damage to the device.
 (2) The crystal manufacturer's specification must satisfy this requirement
 (3) Measured on the TI CC2650EM-5XD reference design with $T_c = 25^\circ\text{C}$, $V_{\text{DDS}} = 3.0 \text{ V}$
 (4) Includes initial tolerance of the crystal, drift over temperature, ageing and frequency pulling due to incorrect load capacitance. As per *Bluetooth* specification.
 (5) Kick-started based on a temperature and aging compensated RCOSC_HF using precharge injection.

5.13 32.768-kHz Crystal Oscillator (XOSC_LF)

$T_c = 25^\circ\text{C}$, $V_{\text{DDS}} = 3.0 \text{ V}$, unless otherwise noted.

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---|-----------------|------|--------|-----|------------------|
| Crystal frequency ⁽¹⁾ | | | 32.768 | | kHz |
| Crystal frequency tolerance, <i>Bluetooth</i> low-energy applications ⁽¹⁾⁽²⁾ | | -500 | | 500 | ppm |
| ESR Equivalent series resistance ⁽¹⁾ | | | 30 | 100 | $\text{k}\Omega$ |
| C_L Crystal load capacitance ⁽¹⁾ | | 6 | | 12 | pF |

(1) The crystal manufacturer's specification must satisfy this requirement
 (2) Includes initial tolerance of the crystal, drift over temperature, ageing and frequency pulling due to incorrect load capacitance. As per *Bluetooth* specification.

5.14 48-MHz RC Oscillator (RCOSC_HF)

Measured on the TI CC2650EM-5XD reference design with $T_c = 25^\circ\text{C}$, $V_{\text{DDS}} = 3.0\text{ V}$, unless otherwise noted.

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|--|-----------------|-----|--------|-----|------|
| Frequency | | | 48 | | MHz |
| Uncalibrated frequency accuracy | | | ±1% | | |
| Calibrated frequency accuracy ⁽¹⁾ | | | ±0.25% | | |
| Start-up time | | | 5 | | μs |

(1) Accuracy relative to the calibration source (XOSC_HF).

5.15 32-kHz RC Oscillator (RCOSC_LF)

Measured on the TI CC2650EM-5XD reference design with $T_c = 25^\circ\text{C}$, $V_{\text{DDS}} = 3.0\text{ V}$, unless otherwise noted.

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|-------------------------------------|-----------------|-----|------|-----|--------|
| Calibrated frequency ⁽¹⁾ | | | 32.8 | | kHz |
| Temperature coefficient | | | 50 | | ppm/°C |

(1) The frequency accuracy of the Real Time Clock (RTC) is not directly dependent on the frequency accuracy of the 32-kHz RC Oscillator. The RTC can be calibrated to an accuracy within ±500 ppm of 32.768 kHz by measuring the frequency error of RCOSC_LF relative to XOSC_HF and compensating the RTC tick speed. The procedure is explained in [Running Bluetooth® Low Energy on CC2640 Without 32 kHz Crystal](#).

5.16 ADC Characteristics

$T_c = 25^\circ\text{C}$, $V_{\text{DDS}} = 3.0\text{ V}$ and voltage scaling enabled, unless otherwise noted.⁽¹⁾

6.3 Main CPU

The SimpleLink CC2640 Wireless MCU contains an ARM Cortex-M3 (CM3) 32-bit CPU, which runs the application and the higher layers of the protocol stack.

The CM3 processor provides a high-performance, low-cost platform that meets the system requirements of minimal memory implementation, and low-power consumption, while delivering outstanding computational performance and exceptional system response to interrupts.

CM3 features include the following:

- 32-bit ARM Cortex-M3 architecture optimized for small-footprint embedded applications
- Outstanding processing performance combined with fast interrupt handling
- ARM Thumb®-2 mixed 16- and 32-bit instruction set delivers the high performance expected of a 32-bit ARM core in a compact memory size usually associated with 8- and 16-bit devices, typically in the range of a few kilobytes of memory for microcontroller-class applications:
 - Single-cycle multiply instruction and hardware divide
 - Atomic bit manipulation (bit-banding), delivering maximum memory use and streamlined peripheral control
 - Unaligned data access, enabling data to be efficiently packed into memory
- Fast code execution permits slower processor clock or increases sleep mode time
- Harvard architecture characterized by separate buses for instruction and data
- Efficient processor core, system, and memories
- Hardware division and fast digital-signal-processing oriented multiply accumulate
- Saturating arithmetic for signal processing
- Deterministic, high-performance interrupt handling for time-critical applications
- Enhanced system debug with extensive breakpoint and trace capabilities
- Serial wire trace reduces the number of pins required for debugging and tracing
- Migration from the ARM7™ processor family for better performance and power efficiency
- Optimized for single-cycle flash memory use
- Ultralow-power consumption with integrated sleep modes
- 1.25 DMIPS per MHz

6.4 RF Core

The RF Core contains an ARM Cortex-M0 processor that interfaces the analog RF and base-band circuitries, handles data to and from the system side, and assembles the information bits in a given packet structure. The RF core offers a high level, command-based API to the main CPU.

The RF core is capable of autonomously handling the time-critical aspects of the radio protocols (*Bluetooth Low Energy*) thus offloading the main CPU and leaving more resources for the user application.

The RF core has a dedicated 4-KB SRAM block and runs initially from separate ROM memory. The ARM Cortex-M0 processor is not programmable by customers.

6.5 Sensor Controller

The Sensor Controller contains circuitry that can be selectively enabled in standby mode. The peripherals in this domain may be controlled by the Sensor Controller Engine which is a proprietary power-optimized CPU. This CPU can read and monitor sensors or perform other tasks autonomously, thereby significantly reducing power consumption and offloading the main CM3 CPU.

The Sensor Controller is set up using a PC-based configuration tool, called Sensor Controller Studio, and potential use cases may be (but are not limited to):

- Analog sensors using integrated ADC
- Digital sensors using GPIOs, bit-banged I²C, and SPI
- UART communication for sensor reading or debugging
- Capacitive sensing
- Waveform generation
- Pulse counting
- Keyboard scan
- Quadrature decoder for polling rotation sensors
- Oscillator calibration

NOTE

Texas Instruments provides application examples for some of these use cases, but not for all of them.

The peripherals in the Sensor Controller include the following:

- The low-power clocked comparator can be used to wake the device from any state in which the comparator is active. A configurable internal reference can be used in conjunction with the comparator. The output of the comparator can also be used to trigger an interrupt or the ADC.
- Capacitive sensing functionality is implemented through the use of a constant current source, a time-to-digital converter, and a comparator. The continuous time comparator in this block can also be used as a higher-accuracy alternative to the low-power clocked comparator. The Sensor Controller will take care of baseline tracking, hysteresis, filtering and other related functions.
- The ADC is a 12-bit, 200-ksamples/s ADC with eight inputs and a built-in voltage reference. The ADC can be triggered by many different sources, including timers, I/O pins, software, the analog comparator, and the RTC.
- The Sensor Controller also includes a SPI–I²C digital interface.
- The analog modules can be connected to up to eight different GPIOs.

The peripherals in the Sensor Controller can also be controlled from the main application processor.

(1) Depending on the package size, up to 16 pins can be connected to the Sensor Controller. Up to 8 of these pins can be connected to analog modules.

6.6 Memory

The flash memory provides nonvolatile storage for code and data. The flash memory is in-system programmable.

The SRAM (static RAM) can be used for both storage of data and execution of code and is split into two 4-KB blocks and two 6-KB blocks. Retention of the RAM contents in standby mode can be enabled or disabled individually for each block to minimize power consumption. In addition, if flash cache is disabled, the 8-KB cache can be used as a general-purpose RAM.

The ROM provides preprogrammed embedded TI RTOS kernel, Driverlib and lower layer protocol stack software (Bluetooth Low Energy Controller). It also contains a bootloader that can be used to reprogram the device using SPI or UART.

6.7 Debug

The on-chip debug support is done through a dedicated cJTAG (IEEE 1149.7) or JTAG (IEEE 1149.1) interface.

6.8 Power Management

To minimize power consumption, the CC2640 device supports a number of power modes and power management features (see [Table 6-2](#)).

| Brown Out Detector (BOD) | Active | Active | Duty Cycled ⁽²⁾ | Off | N/A |
| Power On Reset (POR) | Active | Active | Active | Active | N/A |

(1) Not including RTOS overhead

(2) The Brown Out Detector is disabled between recharge periods in STANDBY. Lowering the supply voltage below the BOD threshold between two recharge periods while in STANDBY may cause the BOD to lock the device upon wake-up until a Reset/POR releases it. To avoid this, it is recommended that STANDBY mode is avoided if there is a risk that the supply voltage (VDDS) may drop below the specified operating voltage range. For the same reason, it is also good practice to ensure that a power cycling operation, such as a battery replacement, triggers a Power-on-reset by ensuring that the VDDS decoupling network is fully depleted before applying supply voltage again (for example, inserting new batteries).

In active mode, the application CM3 CPU is actively executing code. Active mode provides normal operation of the processor and all of the peripherals that are currently enabled. The system clock can be any available clock source (see [Table 6-2](#)).

In idle mode, all active peripherals can be clocked, but the Application CPU core and memory are not clocked and no code is executed. Any interrupt event will bring the processor back into active mode.

In standby mode, only the always-on domain (AON) is active. An external wake event, RTC event, or sensor-controller event is required to bring the device back to active mode. MCU peripherals with retention do not need to be reconfigured when waking up again, and the CPU continues execution from where it went into standby mode. All GPIOs are latched in standby mode.

In shutdown mode, the device is turned off entirely, including the AON domain and the Sensor Controller. The I/Os are latched with the value they had before entering shutdown mode. A change of state on any I/O pin defined as a *wake from Shutdown pin* wakes up the device and functions as a reset trigger. The CPU can differentiate between a reset in this way, a reset-by-reset pin, or a power-on-reset by reading the reset status register. The only state retained in this mode is the latched I/O state and the Flash memory contents.

The Sensor Controller is an autonomous processor that can control the peripherals in the Sensor Controller independently of the main CPU, which means that the main CPU does not have to wake up, for example, to execute an ADC sample or poll a digital sensor over SPI. The main CPU saves both current and wake-up time that would otherwise be wasted. The Sensor Controller Studio enables the user to configure the sensor controller and choose which peripherals are controlled and which conditions wake up the main CPU.

6.9 Clock Systems

The CC2640 supports two external and two internal clock sources.

A 24-MHz crystal is required as the frequency reference for the radio. This signal is doubled internally to create a 48-MHz clock.

The 32-kHz crystal is optional. *Bluetooth* low energy requires a slow-speed clock with better than ± 500 ppm accuracy if the device is to enter any sleep mode while maintaining a connection. The internal 32-kHz RC oscillator can in some use cases be compensated to meet the requirements. The low-speed crystal oscillator is designed for use with a 32-kHz watch-type crystal.

The internal high-speed oscillator (48-MHz) can be used as a clock source for the CPU subsystem.

The internal low-speed oscillator (32.768-kHz) can be used as a reference if the low-power crystal oscillator is not used.

The 32-kHz clock source can be used as external clocking reference through GPIO.

6.10 General Peripherals and Modules

The I/O controller controls the digital I/O pins and contains multiplexer circuitry to allow a set of peripherals to be assigned to I/O pins in a flexible manner. All digital I/Os are interrupt and wake-up capable, have a programmable pullup and pulldown function and can generate an interrupt on a negative or positive edge (configurable). When configured as an output, pins can function as either push-pull or open-drain. Five GPIOs have high drive capabilities (marked in **bold** in [Section 4](#)).

The SSIs are synchronous serial interfaces that are compatible with SPI, MICROWIRE, and Texas Instruments synchronous serial interfaces. The SSIs support both SPI master and slave up to 4 MHz.

The UART implements a universal asynchronous receiver/transmitter function. It supports flexible baud-rate generation up to a maximum of 3 Mbps and is compatible with the *Bluetooth* HCI specifications.

Timer 0 is a general-purpose timer module (GPTM), which provides two 16-bit timers. The GPTM can be configured to operate as a single 32-bit timer, dual 16-bit timers or as a PWM module.

Timer 1, Timer 2, and Timer 3 are also GPTMs. Each of these timers is functionally equivalent to Timer 0.

In addition to these four timers, the RF core has its own timer to handle timing for RF protocols; the RF timer can be synchronized to the RTC.

The I²C interface is used to communicate with devices compatible with the I²C standard. The I²C interface is capable of 100-kHz and 400-kHz operation, and can serve as both I²C master and I²C slave.

The TRNG module provides a true, nondeterministic noise source for the purpose of generating keys, initialization vectors (IVs), and other random number requirements. The TRNG is built on 24 ring oscillators that create unpredictable output to feed a complex nonlinear combinatorial circuit.

The watchdog timer is used to regain control if the system fails due to a software error after an external device fails to respond as expected. The watchdog timer can generate an interrupt or a reset when a predefined time-out value is reached.

The device includes a direct memory access (μDMA) controller. The μDMA controller provides a way to offload data transfer tasks from the CM3 CPU, allowing for more efficient use of the processor and the available bus bandwidth. The μDMA controller can perform transfer between memory and peripherals. The μDMA controller has dedicated channels for each supported on-chip module and can be programmed to automatically perform transfers between peripherals and memory as the peripheral is ready to transfer more data. Some features of the μDMA controller include the following (this is not an exhaustive list):

- Highly flexible and configurable channel operation of up to 32 channels
- Transfer modes:
 - Memory-to-memory
 - Memory-to-peripheral
 - Peripheral-to-memory
 - Peripheral-to-peripheral
- Data sizes of 8, 16, and 32 bits

The AON domain contains circuitry that is always enabled, except for in Shutdown (where the digital supply is off). This circuitry includes the following:

- The RTC can be used to wake the device from any state where it is active. The RTC contains three compare and one capture registers. With software support, the RTC can be used for clock and calendar operation. The RTC is clocked from the 32-kHz RC oscillator or crystal. The RTC can also be compensated to tick at the correct frequency even when the internal 32-kHz RC oscillator is used instead of a crystal.
- The battery monitor and temperature sensor are accessible by software and give a battery status indication as well as a coarse temperature measure.

6.11 Voltage Supply Domains

The CC2640 device can interface to two or three different voltage domains depending on the package type. On-chip level converters ensure correct operation as long as the signal voltage on each input/output pin is set with respect to the corresponding supply pin (VDDS, VDDS2 or VDDS3). lists the pin-to-VDDS mapping.

Table 6-3. Pin function to VDDS mapping table

| | Package | | |
|---------------------------|----------------------|---------------------|--------------------|
| | VQFN 7 × 7 (RGZ) | VQFN 5 × 5 (RHB) | VQFN 4 × 4 (RSM) |
| VDDS⁽¹⁾ | DIO 23–30 Reset_N | DIO 7–14 Reset_N | DIO 5–9 Reset_N |
| VDDS2 | DIO 0–11 | DIO 0–6 JTAG | DIO 0–4 JTAG |
| VDDS3 | DIO 12–22 JTAG | N/A | N/A |

(1) VDDS_DCDC must be connected to VDDS on the PCB

6.12 System Architecture

Depending on the product configuration, CC26xx can function either as a Wireless Network Processor (WNP—an IC running the wireless protocol stack, with the application running on a separate MCU), or as a System-on-Chip (SoC), with the application and protocol stack running on the ARM CM3 core inside the device.

In the first case, the external host MCU communicates with the device using SPI or UART. In the second case, the application must be written according to the application framework supplied with the wireless protocol stack.

7 Application, Implementation, and Layout

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

7.1 Application Information

Very few external components are required for the operation of the CC2640 device. This section provides some general information about the various configuration options when using the CC2640 in an application, and then shows two examples of application circuits with schematics and layout. This is only a small selection of the many application circuit examples available as complete reference designs from the product folder on www.ti.com.

Figure 7-1 shows the various RF front-end configuration options. The RF front end can be used in differential- or single-ended configurations with the options of having internal or external biasing. These options allow for various trade-offs between cost, board space, and RF performance. Differential operation with external bias gives the best performance while single-ended operation with internal bias gives the least amount of external components and the lowest power consumption. Reference designs exist for each of these options.

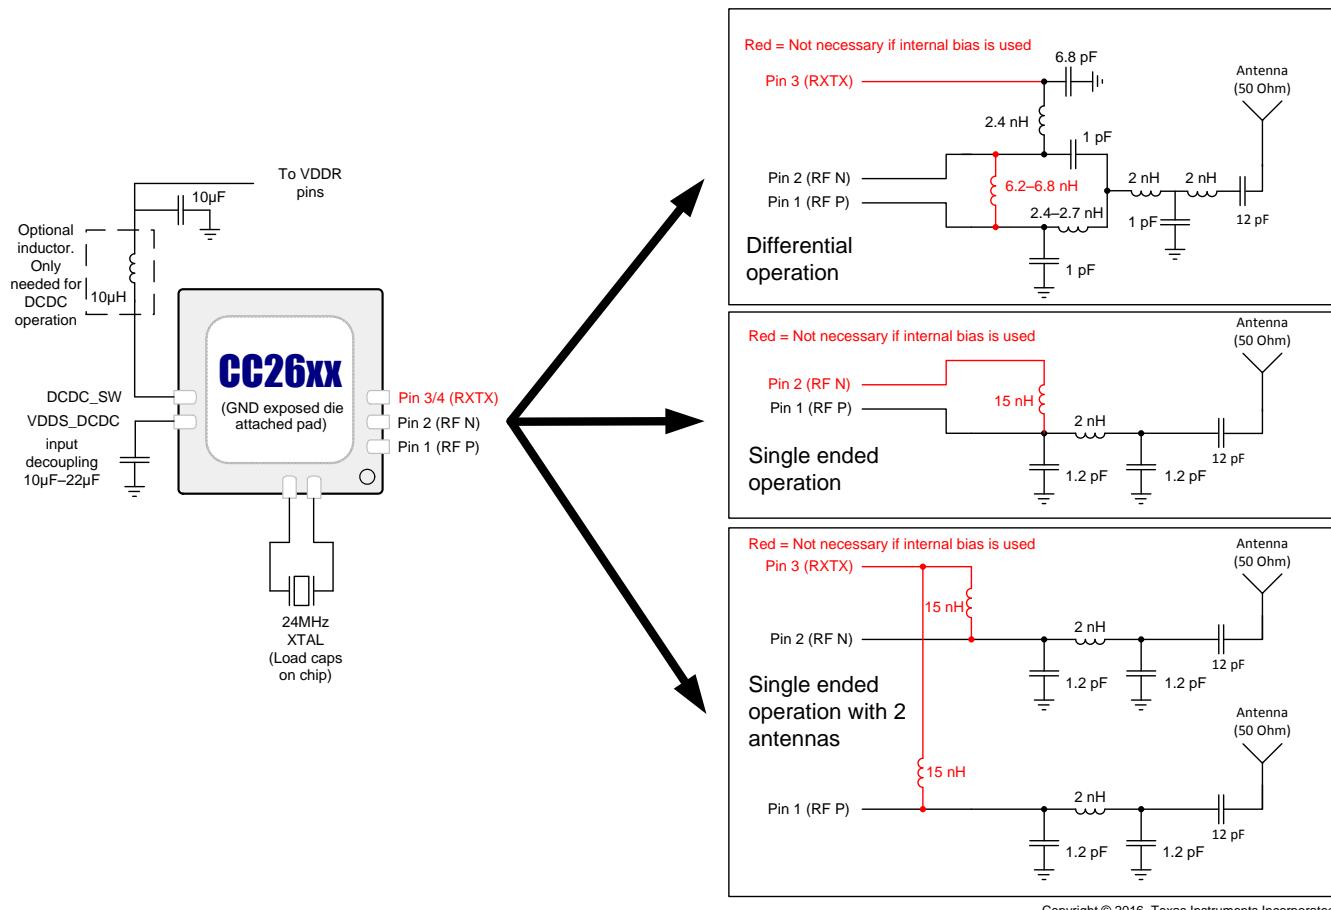

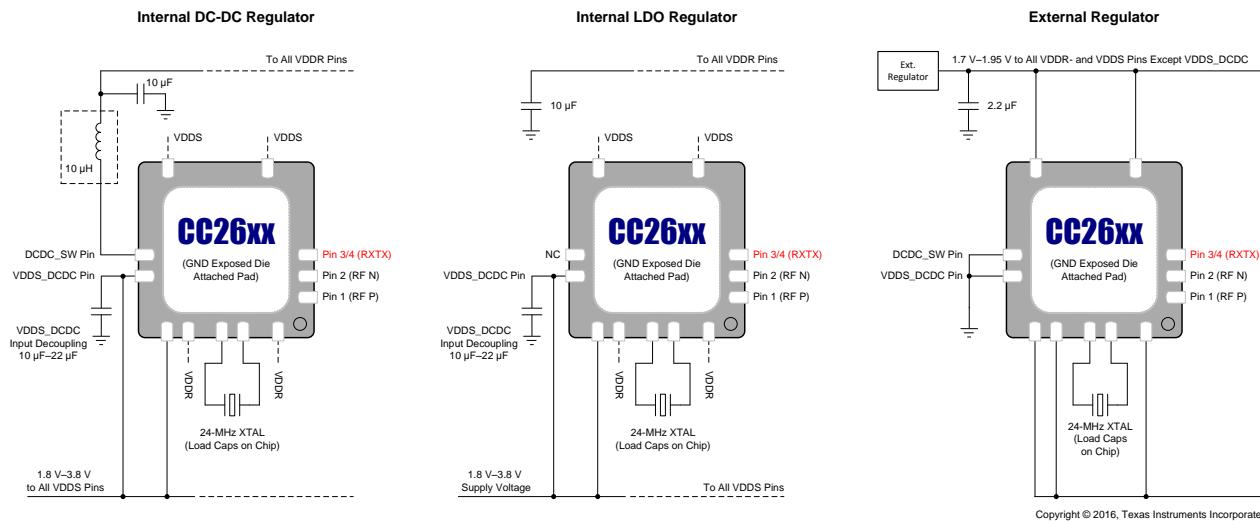

Figure 7-1. CC2640 Application Circuit

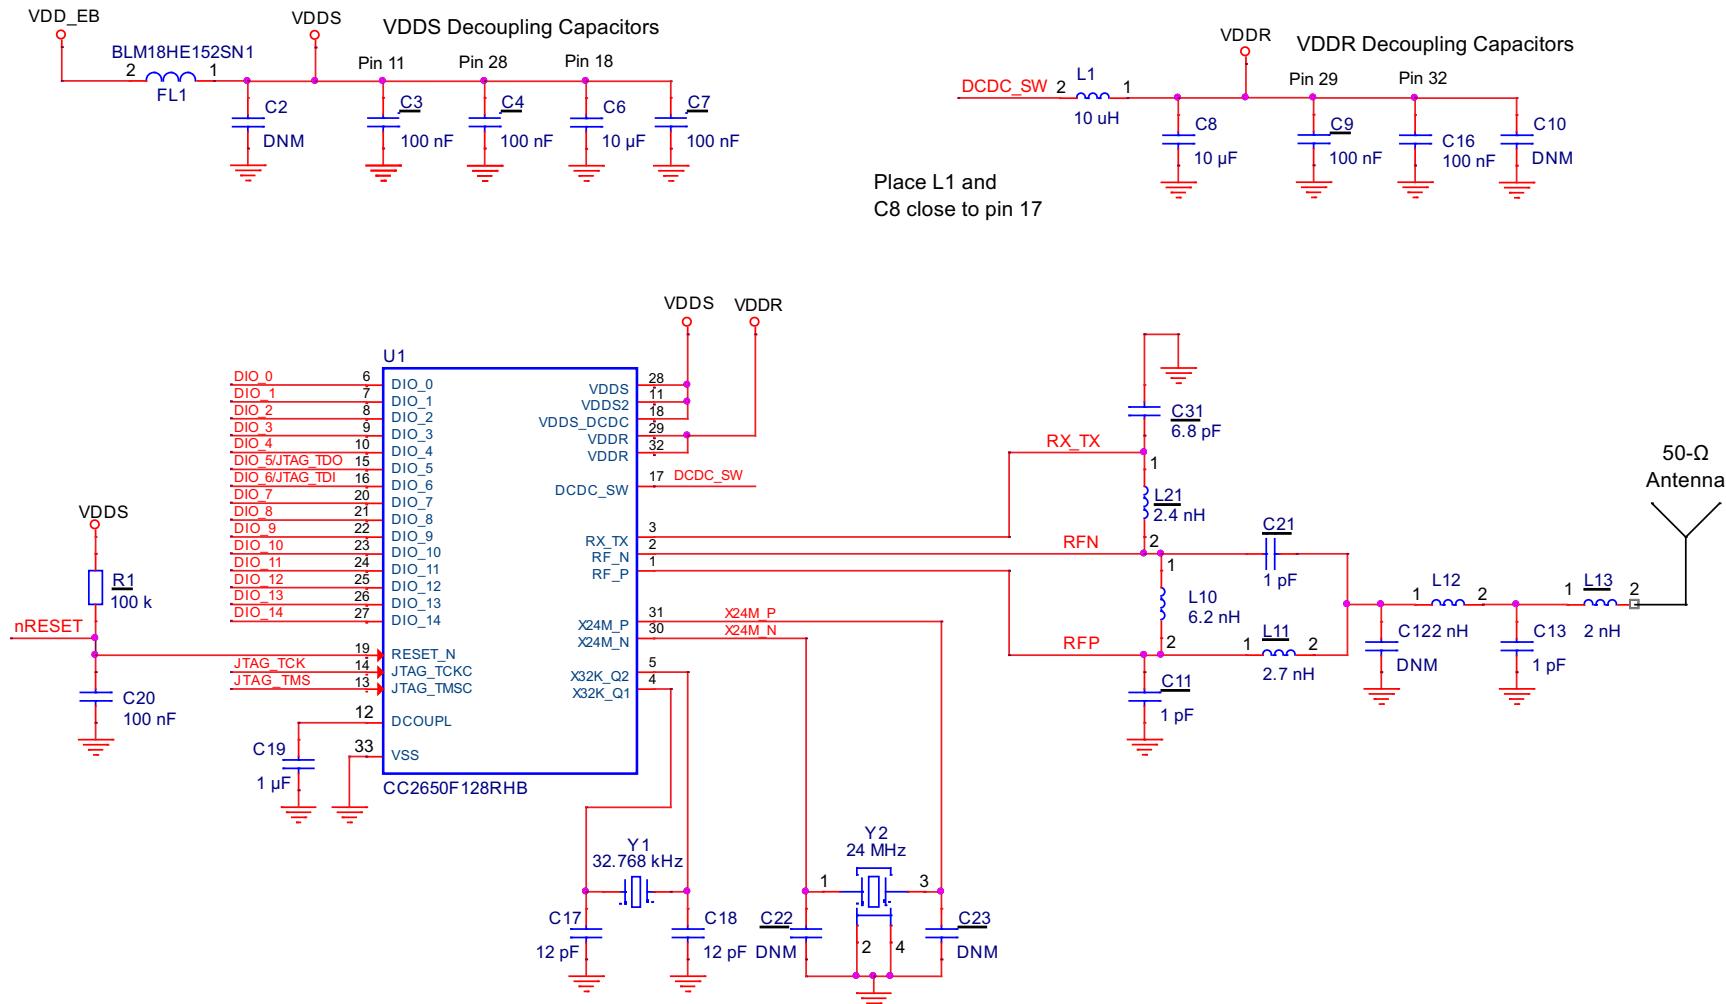

Figure 7-2 shows the various supply voltage configuration options. Not all power supply decoupling capacitors or digital I/Os are shown. Exact pin positions will vary between the different package options. For a detailed overview of power supply decoupling and wiring, see the TI reference designs and the CC26xx technical reference manual (Section 8.3).

8 Device and Documentation Support

8.1 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to all part numbers and date-code. Each device has one of three prefixes/identifications: X, P, or null (no prefix) (for example, CC2640 is in production; therefore, no prefix/identification is assigned).

Device development evolutionary flow:

- X** Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.
- P** Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.
- null** Production version of the silicon die that is fully qualified.

Production devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, *RSM*).

For orderable part numbers of the CC2640 device in the *RSM*, *RHB* or *RGZ* package types, see the Package Option Addendum of this document, the TI website (www.ti.com), or contact your TI sales representative.

8.2 Tools and Software

TI offers an extensive line of development tools, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of the CC2640 device applications:

Software Tools:

[SmartRF Studio 7:](#)

SmartRF Studio is a PC application that helps designers of radio systems to easily evaluate the RF-IC at an early stage in the design process.

- Test functions for sending and receiving radio packets, continuous wave transmit and receive
- Evaluate RF performance on custom boards by wiring it to a supported evaluation board or debugger
- Can also be used without any hardware, but then only to generate, edit and export radio configuration settings
- Can be used in combination with several development kits for Texas Instruments' CCxxxx RF-ICs

[Sensor Controller Studio:](#)

Sensor Controller Studio provides a development environment for the CC26xx Sensor Controller. The Sensor Controller is a proprietary, power-optimized CPU in the CC26xx, which can perform simple background tasks autonomously and independent of the System CPU state.

- Allows for Sensor Controller task algorithms to be implemented using a C-like programming language
- Outputs a Sensor Controller Interface driver, which incorporates the generated Sensor Controller machine code and associated definitions
- Allows for rapid development by using the integrated Sensor Controller task testing and debugging functionality. This allows for live visualization of sensor data and algorithm verification.

IDEs and Compilers:

Code Composer Studio:

- Integrated development environment with project management tools and editor
- Code Composer Studio (CCS) 6.1 and later has built-in support for the CC26xx device family
- Best support for XDS debuggers; XDS100v3, XDS110 and XDS200
- High integration with TI-RTOS with support for TI-RTOS Object View

IAR Embedded Workbench for ARM

- Integrated development environment with project management tools and editor
- IAR EWARM 7.30.3 and later has built-in support for the CC26xx device family
- Broad debugger support, supporting XDS100v3, XDS200, IAR I-Jet and Segger J-Link
- Integrated development environment with project management tools and editor
- RTOS plugin available for [TI-RTOS](#)

For a complete listing of development-support tools for the CC2640 platform, visit the Texas Instruments website at www.ti.com. For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

8.3 Documentation Support

To receive notification of documentation updates, navigate to the device product folder on ti.com ([CC2640](#)). In the upper right corner, click on Alert me to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

8.7 Additional Information

Texas Instruments offers a wide selection of cost-effective, low-power RF solutions for proprietary and standard-based wireless applications for use in industrial and consumer applications. The selection includes RF transceivers, RF transmitters, RF front ends, and Systems-on-Chips as well as various software solutions for the sub-1-GHz and 2.4-GHz frequency bands.

In addition, Texas Instruments provides a large selection of support collateral such as development tools, technical documentation, reference designs, application expertise, customer support, third-party and university programs.

The Low-Power RF E2E Online Community provides technical support forums, videos and blogs, and the chance to interact with engineers from all over the world.

With a broad selection of product solutions, end-application possibilities, and a range of technical support, Texas Instruments offers the broadest low-power RF portfolio.

8.8 Trademarks

SimpleLink, SmartRF, Code Composer Studio, E2E are trademarks of Texas Instruments.

8.9 Electrostatic Discharge Caution

 This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

8.10 Export Control Notice

Recipient agrees to not knowingly export or re-export, directly or indirectly, any product or technical data (as defined by the U.S., EU, and other Export Administration Regulations) including software, or any controlled product restricted by other applicable national regulations, received from Disclosing party under this Agreement, or any direct product of such technology, to any destination to which such export or re-export is restricted or prohibited by U.S. or other applicable laws, without obtaining prior authorization from U.S. Department of Commerce and other competent Government authorities to the extent required by those laws.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

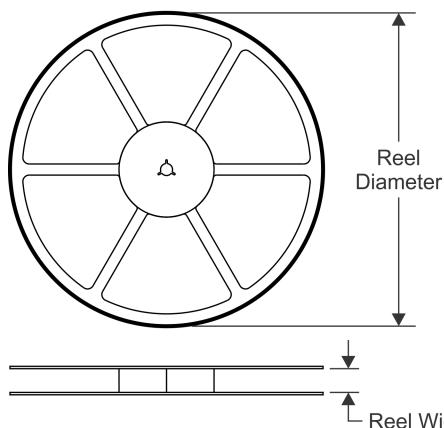

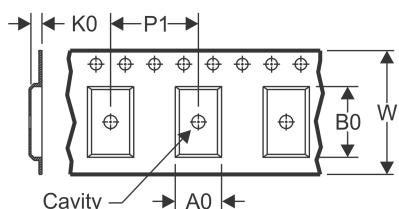

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

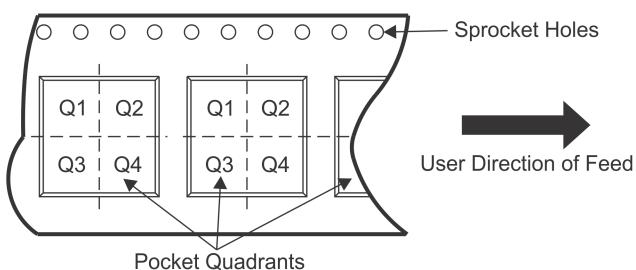

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
